<sup>3</sup> Isolates resistant to oxacillin are interpreted as potentially methicillin resistant.

**Key:**

- 1 Data is reported as: % susceptible (# isolates tested) - not all bacteria isolated at ISU VDL have been tested for antimicrobial susceptibility
  - 2 See Salmonella serotype table for most common serotypes isolated within each group
  - 3 Isolates resistant to oxacillin are interpreted as potentially methicillin resistant.
  - 4 A result of  $\leq 2$  ug/ml for Carbadox is a conservative indicator of bacterial inhibition by this antimicrobial agent. The result shown is based on pharmacokinetic research indicating an average Carbadox level of 4.5 mcg/ml in the small intestine of pigs fed a dose rate of 50 g/ton. (De Graff 1988).
  - 5 In 2015 changes were incorporated into the test method.
